

Car!nk Phase-in Phase-out Application (CI-MSAP)

This application removes any monthly interval restrictions on phase-in and phase-out criteria for your parts inventory!

Phase-in is calculated and measured by the number of **months of sales** within a user-defined period of months, regardless of the amount of pieces that make up those months sales. Phase-out is calculated and measured by the number of **piece sales** for a user-defined period of months. In the past, a user could not set phase-out month test duration for less than the phase-in month test duration. For example, if you wanted to test new parts for as long as 12 months, you could not phase-out currently stocked parts until they had gone 12 or more months without demand.

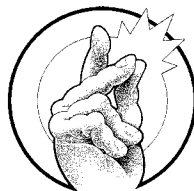

With the restriction removed by this new application, you can allow a part to be tested for phase-in for say, 3 **months of sales** in 12 months, while at the same time, phasing-out parts from that same source, if you have not sold 0 **piece sales** in only 9 months.

By selecting all sources CI-MSAP provides a full screen display of all the phase-in & phase-out criteria setup controlled by your parts logon.

It allows for greater flexibility in your pursuit for tighter inventory control and reduced obsolescence!

Pricing: an upfront List Price: \$213.00 and no monthly license charge.

This is an ADP supported application.
